Appendix

Supplementary Appendix 1. Species list. Percentage cover is included for the 1998 and 2022 columns. The 1939 and 1975 columns show the species found in the surveys conducted by Martin (1939) and Ratkowsky and Ratkowsky (1976).

Abbreviations describing abundance as per Ratkowsky and Ratkowsky (1976):

c = common, i.e., abundant throughout zone; lc = locally common, i.e. abundant only in certain environments within the zone; f = frequent; o = occasional; l = local, i.e. only found in a few localities within the zone, but neither sufficiently abundant to be called locally common, nor sufficiently sparse to be called rare; r = rare; vr = very rare.

Martin (1939) includes the classification of vc = very common.

The species list in Martin (1939) included taxa not found in the survey but that had been recorded by other "reliable collectors"; most of these have been excluded from this list unless they were present in the 1998 and 2022 surveys, as have any species from Martin (1939) that Ratkowsky and Ratkowsky (1976) considered misidentifications.

Species	1939	1976	1998	2022
<i>Abrotenella forsteroides</i> (Hook.f.) Benth	o	lc	0.02	0.61
