**Fig. S1.** Visual assessment of salinity tolerance in barley quantified by using injury scoring index. Score 0 was given to plants showing no symptoms of salt injury; score index 10 is given to dead plants. Plants were treated with extreme saline solution (320 mM) till they died.

**Fig. S2.** Correlation between salt injury index and relative grain yield measured in 12 “core” barley varieties (TX9425, CM72, YWHKSL, YYXT, Numar, ZUG293, Lixi 143, YSM3, Hu 93-045, Aizao 3, Gairdner, YPSLDM and ZUG403). Yield data is taken from Chen *et al.* (2007).

**Fig. S3.** Shoot  $\text{Na}^+$  content (mM) of 46 barley varieties grown under control and salt stress (200 mM NaCl for 35 days) conditions. Mean  $\pm$  s.e. ( $n = 6$ ).

(Please refer to Powerpoint file for figure)

**Fig. S4.** Shoot  $\text{K}^+$  content (mM) of 50 barley varieties grown under control and salt stress (200 mM NaCl for 35 days) conditions. Mean  $\pm$  s.e. ( $n = 6$ ).

(Please refer to Powerpoint file for figure)

**Table 1. Linear correlations coefficients between agronomic and physiological characteristics under salinity stress**

**Abbreviations used:** Gs, stomatal conductance; SD, stomata density; Osm, osmolality; Leaf Na, leaf sap Na content; Leaf K, leaf sap K content; K/Na-leaf, K to Na ratio in the leaf sap. Letters in brackets indicate conditions under which the appropriate parameter was measured (C, control; S, salinity; R, relative value under saline conditions; D, the difference between control and saline treatment). Bold numbers indicate correlation coefficients that are significant at  $P < 0.05$ .
