S1.1. Standards and reagents

Chemicals used as copper fine powder, anhydrous sodium sulphate, sulphuric acid (95 - 97 %) and solvents (dichloromethane -DCM-, hexane, toluene and ethyl acetate) for organic trace analysis were provided from Merck (Darmstadt, Germany). Siliceous earth extrapure, sodium acetate, ammonium acetate, acetic acid, ammonium hydroxide, acetonitrile, methanol, were obtained from Scharlau (Barcelona, Spain).

Oasis WAX cartridges (500 mg, 6 mL) SPE were purchased from Waters (Milford, MA, USA) and EnviCarb cartridges (500 mg, 6 mL) SPE from Sigma-Aldrich (St.Louis, MO, USA)

The analytical standards used in this study are detailed in Table S1.

N.D.: not detected. Concentrations of BDE-209 and DP in leachate and runoff (ng/g d.w.) have been normalized to ng/L.

Water volume (L): absolute volume of leachate or runoff water collected. Amount eluted: amount of pollutants (ng) in leachate or runoff water (corresponding at <0.5 m area). Amount in

soil: amount of pollutants (mg) in soil (< 0.5 m) at the beginning of the experiment. ^{*A} Data showed statistically significant differences ($p < 0.05$; Mann-Whitney U-test) between treatments.

^{*B} Data showed statistically significant differences ($p < 0.05$; Mann-Whitney U-test) between events.

Table S8. Main physicochemical properties of PFOS, BDE-209 and DP for the calculation of leaching potential (L_p) and the Groundwater Ubiquity Score (GUS).

S, V_p , K_{oc} and $T_{1/2}$ values were calculated using EPISuite 4.1 software.

^A $L_p = S/(V_p \times K_{oc})$. Compounds with higher leachability in the environment are indicated by the higher L_p values (Laskowski et al. 1982; Wilson et al. 1996).

^B GUS = $\log_{10}(T_{1/2} \text{ soil}) \times (4 - \log_{10}K_{oc})$. GUS value > 2.8 (Leacher); GUS value = 1.8 - 2.8 (Transition zone); GUS value < 1.8 (Non-leacher) (Gustafson 1989).
