#### Abstract

Salts of marine origin, predominantly consisting of $\mathrm{Na}^{+}$and $\mathrm{Cl}^{-}$ions, are dominant in most Australian inland saline waters. The proportions of other ions, $\mathrm{Ca}^{2+}, \mathrm{Mg}^{2+}, \mathrm{SO}_{4}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}$and $\mathrm{CO}_{3}{ }^{2-}$, in the water may influence salinity tolerance of freshwater organisms and thus the effect of increasing salinity may vary with difference in ionic proportions. We exposed freshwater invertebrates to different concentrations of four ionic compositions and compared them with commercial sea salt (Ocean Nature). They were: synthetic Ocean Nature (ONS) and three saline water types (ONS but without: $\mathrm{SO}_{4}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}$and $\mathrm{CO}_{3}{ }^{2-}(\mathrm{S} 1) ; \mathrm{Ca}^{2+}, \mathrm{HCO}_{3}{ }^{-}$and $\mathrm{CO}_{3}{ }^{2-}(\mathrm{S} 2)$; and $\mathrm{Ca}^{2+}$ and $\mathrm{Mg}^{2+}$ (S3)), which are considered to be the predominant saline water types in south-eastern Australia and the Western Australian wheatbelt. The $96-\mathrm{h}_{\mathrm{LC}}^{50}$ values for the five media were determined for six invertebrate species and sub-lethal responses were observed for two species. There were no differences between responses of invertebrates to various ionic compositions in acute toxicity tests. However, in prolonged sub-lethal tests, animals reacted differently to the various ionic compositions. The greatest effect was observed in water types lacking Ca , for which plausible physiological mechanisms exist. Variation in ionic proportions should be taken into account when considering sub-lethal effects of salinity on freshwater invertebrates.

Table 1. Water quality data from collection sites

| Date | Site | Species collected | $\qquad$ | Water temperature $\left({ }^{\circ} \mathrm{C}\right)$ | Electrical conductivity $\left(\mu \mathrm{Scm}^{-1}\right)$ | pH | $\begin{gathered} \text { DO } \\ \text { (\% saturation) } \end{gathered}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| 21/09/04 | King Parrot Creek | Notalina fulva Micronecta robusta Centroptilum sp. | 10 | 9.3 | 42 | 7.36 | 117 |
| 11/10/04 | Campaspe River | Physa acuta | 17.2 | 16.2 | 626 | 6.5 | 95 |
| 19/10/04 | Campaspe River | Physa acuta | 16.2 | 15.3 | 625 | 7.03 | 95 |

Table 2. Composition ( $\mathrm{mg} \mathrm{L}^{-1}$ ) of stock solutions of different types
Compounds with a concentration $<5 \mathrm{mg} \mathrm{L}^{-1}$ were concentrated 1000 times and combined to prepare a stock solution ( 1 mL was added per 1 L of the final solution)

| Compound | ONS | S1 | S2 | S3 |
