

may have thought it a corruption of 'Rose-hill' and incorrectly rendered 'Rosetta' as 'Rosella.'

Thanks are due to Messrs. A. H. Chisholm, H. T. Condon, and K. A. Hindwood, Mr. G. H. Pitt of the South Australian Archives, and Miss Ida Leeson of the Mitchell Library, for valuable assistance rendered, and from such kindly action it must not be necessarily inferred that they agree with the deductions made.

Little Wood-Swallow in Victoria.—Each year flocks of Tree-Martins visit this district, arriving, usually, early in September. Last year, 1941, a flock right in the Edenhope township, where the Apsley road runs off, included a single Little Wood-Swallow (*Artamus minor*), a bird that is unmistakable. It had evidently accompanied the Tree-Martins from the north. It hawked for insects with them, but when they settled on the telegraph wires, it always perched in a roadside tree. I saw the bird on several occasions, but it only stayed a few days, although the Tree-Martins remained. Normally, the range of the Little Wood-Swallow extends southwards only to about the northern parts of New South Wales.—HUGH COLLINS, Edenhope, Vic., 22/5/42.

All contributions previously set and held, a number for some time, have been used in this issue. Hereafter papers will be published, generally, according to priority of receipt by the Editor. Publication may be delayed in the case of long papers and those with illustrations.
