differentiate health inequalities impact assessment from health impact assessment, instead concluding that every HIA should be a health inequalities impact assessment.5 Here we describe the development of a framework to guide equity-focussed HIA. Although the terms ‘equity-focussed HIA’ and ‘health inequalities impact assessment’ have been used synonymously in the literature, our collaboration used the term ‘equity-focussed health impact assessment’ instead of ‘health inequalities impact assessment’ as we wished to communicate that assessment of equity impacts was integral to HIA instead of a different process.

A review of 30 reports in the literature describing HIAs found that in practice few had explored equity impacts routinely or systematically, although some tools for health inequalities impact assessment had emerged.6 This reinforced our commitment to develop and pilot a framework for equity-focused health impact assessment that could be integral to the HIA, and used to explicitly consider the impacts on health inequalities that may result from a policy, plan or program.

In 2002, building on our work to develop policy-linked HIA² and also on using socioeconomic evidence in health decision-making 3, researchers from the Newcastle Institute of Public Health (NIPH), the Centre for Health Equity Training, Research and Evaluation (CHETRE) and the Health Impact Assessment Research Unit at Deakin University established the Australasian Collaboration for Health Equity Impact Assessment (ACHEIA). Together with our case-study partners and international advisors from the Cochrane and Campbell Collaborations and from

HIA centres of excellence in the United Kingdom and New Zealand, we developed our framework. We then undertook the following five equity-focussed HIAs:

1. Healthy eating action policy (New Zealand Ministry of Health)
2. Dietary guidelines for older Australians (National Health and Medical Research Council)
3. Continuing education and professional development program for rural medical specialists (Royal Australasian College of Physicians)
4. Community funding program of health promotion grants and sponsorships (Australian Capital Territory Health Promotion Board)
5. Outpatient cardiac rehabilitation program (John Hunter Hospital, Newcastle, NSW).

Our framework differs from other tools for health inequalities or equity impact assessment in that the framework is embedded in conventional HIA. To each HIA step we added discrete questions or processes that triggered the exploration of critical equity considerations. A copy of the equity-focussed health impact assessment framework and reports on selected equity-focussed health impact assessments can be found at http://chetre.med.unsw.edu.au/files/EFHIA_Framework.pdf or www.deakin.edu.au/hia.

In undertaking the equity-focussed health impact assessments we found that we were able to:

- identify in a proposal its potential for unintended anti-equality consequences
- generate recommendations that enhanced the potential for equity to be realised, potentially leading to a reduction in health inequalities.

Two examples illustrate the diverse settings in which equity-focussed health impact assessment might illuminate the health equity impacts of a proposal or plan. The Royal Australasian College of Physicians’ equity-focussed health impact assessment found that while videoconferencing was widely regarded as having the potential to improve professional development for rural medical specialists, equity issues arose where access to videoconferencing was limited by technology. Where technology in rural areas does not keep pace with emerging Internet-based programs, a professional development program based on videoconferencing or internet programs may actually widen the educational gap between urban and rural specialists, with a flow-on effect to the communities they serve.

The equity-focussed health impact assessment of the New Zealand policy for healthy eating found that the policy development process had the potential to make it more difficult for certain groups to contribute to policy development, potentially resulting in a healthy eating policy that was limited in effectiveness for those groups, and particularly for Maori. As a result of the equity-focussed health impact assessment, recommendations were developed that focussed both on changing the approach to policy and strategy development within the New Zealand Ministry for Health, and on ensuring that equity issues were addressed as the healthy eating policy was implemented.

While equity remains a key principle of HIA, a more explicit analysis of the social and geographic distribution of the health impacts, and an assessment of the fairness of this distribution, is usually required. The equity-focussed health impact assessment framework is useful in these situations because it provides practitioners with guidance on how to systematically address equity in each step of HIA.

ACKNOWLEDGEMENTS

We wish to acknowledge the help provided by our case-study partners and by the many advisors, researchers and health professionals who assisted in the development and piloting of the equity-focussed health impact assessment framework.
