# ROTATING POLYTROPES IN THE POST-NEWTONIAN APPROXIMATION* 

By A. W. Sudbury $\dagger$

It has been suggested by Fowler (1966) that rotation would make a star more stable, and Durney and Roxburgh (1967) have arrived at the same result, but so far the problem has not been treated without assuming that the star retains its shape (which it does not), and the post-Newtonian rotation terms have not been included. As a first step the equilibrium problem must be solved, and in this case the star is assumed to be a polytrope.

The field equations in the post-Newtonian approximation have been given by Chandrasekhar (1965), and for a uniformly rotating star with axial symmetry his equation (41) becomes
where

$$
\begin{equation*}
\nabla^{2} \Phi=-4 \pi G\left(3 p+2 \rho U+2 \rho \Omega^{2} R^{2} \cos ^{2} \phi+\rho \Pi\right) \tag{1}
\end{equation*}
$$

$$
g_{00}=1-\frac{2 U}{c^{2}}+\frac{1}{c^{4}}\left(2 U^{2}-2 \Phi\right)+O\left(c^{-6}\right)
$$

and $U$ is the Newtonian potential, $\Omega$ the angular velocity of the star, and $\phi$ the latitude. Chandrasekhar's equation (45) becomes
where

$$
\begin{gather*}
\nabla^{2} \psi^{(3)}-\frac{\psi^{(3)}}{R^{2} \cos ^{2} \phi}=-8 \pi G R \cos \phi \Omega \rho  \tag{2}\\
g_{03}=\frac{2 \psi^{(3)}}{c^{3}}+O\left(c^{-5}\right)
\end{gather*}
$$

The corresponding term in the metric is

$$
\frac{4 \psi^{(3)}}{c^{2}} R \cos \theta \mathrm{~d} \phi \mathrm{~d} t
$$

The post-Newtonian field equations are not, in general, soluble for any particular order of approximation in $1 / c^{2}$. To obtain the extra equation required one must either use some of the field equations of the next order of approximation or, more simply, the conservation laws.

Chandrasekhar's equation (67) becomes

$$
\begin{align*}
0=- & P_{R}+ \\
+ & \rho U_{R}+\rho R \cos ^{2} \phi \Omega^{2} \\
+\frac{1}{c^{2}}\{ & 2 R^{2} \cos ^{2} \phi \Omega^{2} \rho U_{R}+\rho \Phi_{r}+P U_{R}-2 R \cos \phi \rho \Omega \psi_{R}^{(3)} \\
& \quad+4 \rho R \cos ^{2} \phi \Omega^{2} U-2 \rho \cos \phi \Omega \psi^{(3)}+R \cos ^{2} \phi \Omega^{2} P  \tag{3}\\
& \left.\quad+\rho \Pi\left(U_{R}+R \Omega^{2} \cos ^{2} \phi\right)-P_{R}^{(2)}\right\}
\end{align*}
$$

[^0]where the pressure $=P+P^{(2)} / c^{2}, P$ being the Newtonian value. The terms not in $1 / c^{2}$ give the Newtonian equation.

As the star is a polytrope

$$
\begin{equation*}
P=K \rho^{1+1 / n} \tag{4}
\end{equation*}
$$

and we put

$$
\begin{equation*}
\rho=\lambda \Theta^{* n}, \quad P=\lambda^{1+1 / n} K \Theta^{* n+1} \tag{5}
\end{equation*}
$$

where

$$
\begin{equation*}
\Theta^{*}=\Theta\left(1+\mu / c^{2}\right) \tag{6}
\end{equation*}
$$

$\Theta$ being the Newtonian value as in Chandrasekhar (1933) except that $A_{2}$ has a different value. Then,

$$
\begin{equation*}
\Pi=n \lambda \Theta^{n} \mu, \quad P^{(2)}=(n+1) K \lambda^{1+1 / n} \Theta^{n+1} \mu \tag{7}
\end{equation*}
$$

Now, using the Newtonian equation of (3) we find that

$$
\frac{1}{\rho}\left\{\rho \Pi\left(U_{R}+R \Omega^{2} \cos ^{2} \phi\right)-P_{R}^{(2)}\right\}=-R_{0}(\mu \Theta)^{\prime},
$$

where $R_{0}=(n+1) \lambda^{1 / n} K$ and the prime denotes differentiation with respect to $R$. We can integrate the relativistic part of (3) to get

$$
\begin{equation*}
\Phi=2 \psi^{(3)} R \Omega \cos \phi+R_{0} \Theta\left\{\mu-\frac{R_{0} \Theta}{2(n+1)}\right\}-2 R^{2} \cos ^{2} \phi \Omega^{2} U+g(\phi) \tag{8}
\end{equation*}
$$

Corresponding to (3) there is a similar conservation equation for $\phi$, and its significance is that $g(\phi)$ is constant, call it $c_{0}$.

Putting $\psi^{(3)}=\Omega \psi(R) \cos \phi$ we obtain

$$
\begin{equation*}
\psi_{R R}+\frac{2 \psi_{R}}{R}-\frac{2 \psi}{R^{2}}=-8 \pi G_{\rho} R \tag{9}
\end{equation*}
$$

In vacuo $\psi \propto 1 / R^{2}$ as $\psi \rightarrow 0$ as $R \rightarrow \infty$, and so

$$
\begin{equation*}
\psi(\xi)=\frac{8 \pi G A^{3}}{3}\left(\xi \int_{\xi}^{\xi_{1}} \rho x \mathrm{~d} x+\frac{1}{\xi^{2}} \int_{0}^{\xi} \rho x^{4} \mathrm{~d} x\right) \tag{10}
\end{equation*}
$$

where $R=A \xi$ and $\xi_{1}$ is the first zero of the Emden equation

$$
\begin{equation*}
A=\left(\frac{R_{0}}{4 \pi G \lambda}\right)^{\frac{1}{2}} \tag{11}
\end{equation*}
$$

Since to the approximation required

$$
\rho=\lambda \theta^{n} \text { and } \frac{1}{\xi^{2}} \frac{\mathrm{~d}}{\mathrm{~d} \xi}\left(\xi^{2} \frac{\mathrm{~d} \theta}{\mathrm{~d} \xi}\right)=-\theta^{n}
$$

these integrals can be simplified to
where

$$
\begin{gather*}
\psi(\xi)=\frac{8}{3} \pi G A^{3} \lambda f(\xi)  \tag{12}\\
f(\xi)=\xi\left\{3 \theta(\xi)-\xi_{1} \theta^{\prime}\left(\xi_{1}\right)\right\}-\frac{6}{\xi^{2}} \int_{0}^{\xi} \xi^{2} \theta \mathrm{~d} \xi \tag{13}
\end{gather*}
$$

$\mu$ can be eliminated from equations (1), (7), and (8) to give
$\nabla_{\xi}^{2} \Phi^{*}+n \Theta^{n-1} \Phi^{*}=\frac{2 n v}{3} \xi f(\xi) \theta^{n-1} \cos ^{2} \phi-\frac{5(n+2)}{2(n+1)} \Theta^{n+1}-\frac{(2 n+1)}{2} v \xi^{2} \cos ^{2} \phi \theta^{n}$,
where

$$
\begin{equation*}
\Phi^{*}=\frac{\Phi-c_{0}}{R_{0}^{2}}, \quad v=\frac{\Omega^{2}}{2 \pi G \lambda} . \tag{14}
\end{equation*}
$$

$U$ is the same as $V$ in equation (32) of Chandrasekhar (1933), and the expression given there for $V$ has been substituted for $U$.

Put

$$
\Phi^{*}=\Phi^{(11)}(\xi)+v\left\{\Phi^{(12)}(\xi)+\Phi^{(2)}(\xi) \cos ^{2} \phi\right\}
$$

then

$$
\begin{align*}
& \Phi_{\xi \xi}^{(11)}+\frac{2}{\xi} \Phi_{\xi}^{(11)}+n \theta^{n-1} \Phi^{(11)}=-\frac{5(n+2)}{2(n+1)} \theta^{n+1}  \tag{15}\\
& \begin{aligned}
& \Phi_{\xi \xi}^{(12)}+\frac{2}{\xi} \Phi_{\xi}^{(12)}+\frac{4 \Phi^{(2)}}{\xi^{2}}+n \theta^{n-1} \Phi^{(12)}+n(n-1) \theta^{n-2} \Phi^{(11)}\left(\psi_{0}+A_{2} \psi_{2}\right) \\
&=\frac{5(n+2)}{2} \theta^{n}\left(\psi_{0}+A_{2} \psi_{3}\right) \\
& \Phi_{\xi \xi}^{(2)}+\frac{2}{\xi} \Phi_{\xi}^{(2)}+\left(n \theta^{n-1}-6 \xi^{-2}\right) \Phi^{(2)}-\frac{3 n(n-1) \theta^{n-2} A_{2} \psi_{2} \Phi^{(11)}}{2} \\
&=\frac{2 n \xi}{3} f(\xi) \theta^{n-1}+\frac{\theta^{n}}{2} \frac{15(n+2) A_{2} \psi_{2}}{2}-(2 n+1) \xi^{2}
\end{aligned}
\end{align*}
$$

where $A_{2}, \psi_{0}$, and $\psi_{2}$ are as in Chandrasekhar (1933).
To find the boundary conditions we note that, at $\Theta=0$, equation (8) gives

$$
\begin{equation*}
\frac{\Phi^{*}-c_{0}}{R_{0}^{2}}=\frac{2}{3} v \xi f(\xi) \cos ^{2} \phi \tag{18}
\end{equation*}
$$

The boundary is given by

$$
\begin{equation*}
\xi_{0}=\xi_{1}-\frac{v}{\theta^{\prime}\left(\xi_{1}\right)}\left\{\psi_{0}\left(\xi_{1}\right)+A_{2} \psi_{2}\left(\xi_{1}\right)\left(1-\frac{3}{2} \cos ^{2} \phi\right)\right\}, \tag{19}
\end{equation*}
$$

and so we obtain

$$
\Phi^{(11)}\left(\xi_{1}\right)=0, \quad \Phi^{(12)}\left(\xi_{1}\right)=\frac{\Phi^{\prime(11)}\left(\xi_{1}\right)}{\theta^{\prime}\left(\xi_{1}\right)}\left\{\psi_{0}\left(\xi_{1}\right)+A_{2} \psi_{2}\left(\xi_{1}\right)\right\},
$$

and

$$
\begin{equation*}
\left.\Phi^{(2)}\left(\xi_{1}\right)=\frac{2}{3} \xi_{1} f\left(\xi_{1}\right)-3 A_{2} \frac{\psi_{2}\left(\xi_{1}\right)}{2 \theta^{\prime}\left(\xi_{1}\right)} \Phi^{\prime(11)}\left(\xi_{1}\right) . \quad\right\} \tag{20}
\end{equation*}
$$

$A_{2}$ is determined using the fact that $U+\Phi / c^{2}$ must be continuous over the boundary. We note that we may equate the external and internal solutions over the sphere
$\xi=\xi_{1}$, because their second derivatives will be continuous if the functions and their first derivatives are. This leads to

$$
\begin{equation*}
A_{2}=\frac{-\frac{5}{6} \xi_{1}^{2}+2 \sigma\left\{\Phi^{(2)}\left(\xi_{1}\right)-\frac{1}{3} \xi \Phi^{\prime(2)}\left(\xi_{1}\right)\right\}}{3 \psi_{2}\left(\xi_{1}\right)+\xi_{1} \psi_{2}{ }^{\prime}\left(\xi_{1}\right)} \tag{21}
\end{equation*}
$$

where $\sigma=R_{0} / c^{2}$.
The equations for the $\Phi$ 's were solved numerically. In each case there is a value to be guessed at the origin; however, owing to the linearity of the equations, once two trials have been made the correct figure can be determined exactly. The results of the numerical integrations are given in Table 1.

Table 1
METRIC COEFFICIENTS FOR A ROTATING POLYTROPE OF INDEX $n=3$

| $\xi / \xi_{1}$ | $f(\xi)$ | $\Phi^{(11)}$ | $\Phi^{(12)}$ | $\Phi^{(2)}$ |
| :---: | :---: | :---: | :---: | :---: |
| 0 | 0 | $-0 \cdot 3933$ | $808 \cdot 1$ | 0 |
| $0 \cdot 1$ | $0 \cdot 8032$ | -0.5208 | $636 \cdot 8$ | $-0.3521$ |
| $0 \cdot 2$ | 1-199 | $-0.6957$ | $299 \cdot 1$ | $-2.087$ |
| $0 \cdot 3$ | 1-201 | $-0.7085$ | $31 \cdot 03$ | $-4.756$ |
| $0 \cdot 4$ | 1.014 | -0.5964 | $-113.4$ | $-7 \cdot 128$ |
| $0 \cdot 5$ | 0.7939 | -0.4501 | $-170 \cdot 6$ | $-8 \cdot 927$ |
| $0 \cdot 6$ | 0.6043 | -0.3165 | $-179 \cdot 0$ | $-10 \cdot 45$ |
| $0 \cdot 7$ | $0 \cdot 4600$ | -0.2076 | $-159 \cdot 7$ | $-12 \cdot 06$ |
| $0 \cdot 8$ | $0 \cdot 3558$ | $-0 \cdot 1219$ | $-121.9$ | $-13 \cdot 99$ |
| $0 \cdot 9$ | $0 \cdot 2815$ | $-0.0542$ | $-67 \cdot 79$ | $-16 \cdot 4$ |
| 1 | $0 \cdot 228$ | 0 | $3 \cdot 86$ | $-19 \cdot 35$ |

Now that the structures of rotating polytropes in general relativity have been determined it will be possible to investigate the stability of their oscillations, and this I hope to make the subject of a future paper.

In conclusion I should like to thank Professor R. Van der Borght for his valuable advice and discussion.
