1 **File S1. Interview schedule**

2 **Part 1. Information resources and mobile phone apps**

3 1. What kinds of resources or aids do you use with your patients with diabetes? *[prompt for:*
4 *pamphlets, websites, phone services.]*

5 2. What do you think about phone apps for diabetes?

6 3. We are in the process of designing a smartphone app to help patients with self-management of
7 diabetes. Each patient's account will be linked to their GP to facilitate feedback, communication
8 and/or monitoring. There are potentially many benefits to integrating healthcare providers into the
9 app; however, it is also important that this doesn't place too much burden on the healthcare
10 providers. How do you think we could balance these two needs?

11 4. Do you think apps could be useful for your patients who are culturally and linguistically diverse?
12 *[prompt for: Why/why not]*

13 5. One of the aims of the app is to save the practitioner time and effort where possible while
14 maintaining a high quality of care. I will go through some of the possible strategies to achieve
15 this:

16 a. Transfer the patient's care plan into the app. For example, blood glucose levels can be assessed
17 automatically by the app using targets set by the doctor. Would this be a useful feature?
18 What problems/risks do you foresee with this approach?

19 b. Data export function for blood glucose monitoring data/physical activity to be used during GP
20 consultations. Would this be a useful feature? How would you use this information in a
21 consultation?

22 c. Prompt for patient to see their doctor (e.g. if they had several very high blood glucose levels)
23 and periodic reminders for check-ups with their GP and eye and foot checks with specialists.
24 *[can include manually implemented and automatic prompts]* How useful would this feature
25 be? What problems/risks do you think there might be?

26 6. GoShare Healthcare is an interface that allows GPs to 'bundle' videos and educational material
27 from a database of materials, and then either email or text these resources to patients. Each patient
28 can receive their own specific bundle for their needs. It has been used in Victoria by GPs as a way
29 to improve communication with patients. How would you feel about using this kind of resource to
30 communicate with your patients?

31 7. I'd like to go back to the patient scenarios we discussed before. I will show you examples of app
32 content or output from three different patients. This information will be similar to what you would
33 receive as a 'summary report' of the patients' self-management and blood glucose readings.

34 [provide participant with example output for a patient with several low blood glucose readings, one
35 with mostly on-target blood glucose readings and one with several high blood glucose readings].

36 How would this app output change the way you manage these patients? [*prompt for: any key*
37 *information missing?*]

38 What kinds of things would you want to feed back into the app?

39 **Part 2. Any additional feedback?**

40 8. Do you have any additional feedback regarding patient self-management or diabetes or how this
41 could be integrated into an app?

42 **Figure S1. Summary report presented to GPs during the interview**

43

Summary of blood glucose self-monitoring for [First name] [Last name], DD/MM/YYYY-
DD/MM/YYYY

Blood glucose level key

Blood glucose level	Range (mmol/L)	
	Preprandial	Postprandial
Very low	≤2.9	≤2.9
Low	3.0-4.9	3.0-4.9
On-target	5.0-9.9	5.0-11.9
High	10.0-11.9	12.0-13.9
Very high	≥12.0	≥14.0

Proportion of blood glucose readings in each level

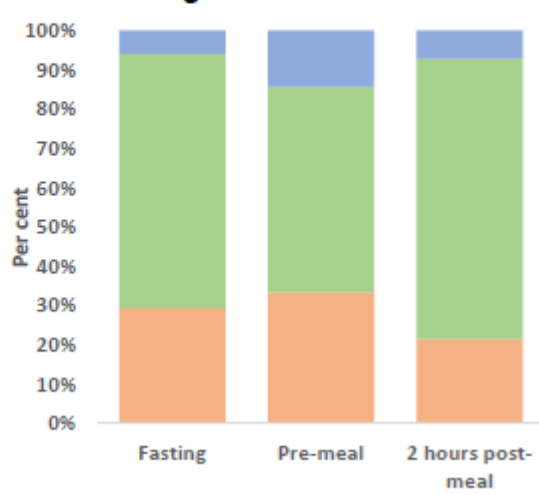

Daily output

Day	Blood glucose level (mmol/L)		
	Fasting	Pre-meal	2 hours post-meal
1	4.1	7.2	7.8
2	4.8		
3		3.4	
4		4.7	
5		9.3	
6		10.2	
7	7.6		9.5
8		6.6	
9	4.2	6.6	12.
10	7.3	5.1	8.0
11			10.7
12		9.9	
13	9.8	5.0	10.0
14	10.	9.6	9.1
15		10.0	
16	8.5		8.5
17		4.0	8.5
18	6.7	4.2	4.1
19	4.0		
20	9.6	10.3	
21		4.4	4.0
22			
23	6.8	8.9	3.3
24	9.6	9.3	
25	3.3		9.8
26	5.6	9.9	8.9
27	9.2	3.0	
28	7.4	2.4	

Proportion of blood glucose levels by time of testing

*NB: Daily results indicate the average of readings in each of the pre/post prandial/fasting categories.

44

45 **Table S1. Consolidated Criteria for Reporting Qualitative Studies (COREQ) checklist**

46 Domains 1 and 2 from the COREQ. Developed by [Tong et al. 2007](#)

Number of item	Guide questions/description	Notes
Domain 1. Research team and reflexivity		
<i>Personal characteristics</i>		
1. Interviewer/facilitator	Which author/s conducted the interview or focus group?	Interviews were facilitated by the first author (J. Ayre).
2. Credentials	What were the researcher's credentials? (e.g. PhD, MD)	J. Ayre: B.LibSt (Hons in Psychology)
3. Occupation	What was their occupation at the time of the study?	At the time of the interviews, J. Ayre was a PhD candidate.
4. Gender	Was the researcher male or female?	The researcher was female.
5. Experience and training	What experience or training did the researcher have?	J. Ayre was trained in qualitative methods.
<i>Relationship with participants</i>		
6. Relationship established	Was a relationship established before study commencement?	J. Ayre did not have any direct contact with participants prior the interviews. J. Ayre was introduced to participants through the health professionals involved in joint specialist case conferencing.
7. Participant knowledge of the interviewer	What did the participants know about the researcher? (e.g. personal goals, reasons for doing the research).	Participants were informed that the researcher was interested in interviewing GPs about diabetes apps as part of her PhD, with a view to informing the design of an app that would be created by Western Sydney Diabetes, a group of collaborating local health authorities.
8. Interviewer characteristics	What characteristics were reported about the interviewer/facilitator? (e.g. bias, assumptions, reasons and interests in the research topic).	Participants were informed that the researcher was interested in interviewing GPs about diabetes apps as part of her PhD, with a view to informing the design of an app that would be created by Western Sydney Diabetes, a group of collaborating local health authorities.
Domain 2. Study design		
<i>Theoretical framework</i>		
9. Methodological orientation and theory	What methodological orientation was stated to underpin the study? (e.g. grounded theory, discourse analysis, ethnography, phenomenology, content analysis).	Methods used in this study were based on phenomenology and framework analysis. Phenomenology focuses on individual's experience, and is appropriate for our interest in PCPs perceptions and attitudes towards a proposed diabetes app.
<i>Participant selection</i>		
10. Sampling	How were participants selected? (e.g. purposive, convenience, consecutive, snowball).	Participants were purposively sampled to ensure a diverse range of gender, years of experience and cultural backgrounds. Participants were recruited from Western Sydney, an area with culturally and linguistically diverse patient populations. Participants were recruited from a pool of 50 clinics in Western Sydney who had elected to engage in joint

11. Method of approach	How were participants approached? (e.g. face-to-face, telephone, mail, email).	specialist case conferencing, an initiative implemented through the Western Sydney Primary Health Network. During case conferencing, the PCP discusses diabetes management with the patient, in conjunction with an endocrinologist and a credentialed diabetes educator.
12. Sample size	How many participants were in the study?	Participants were approached face-to-face in the PCP's clinic on days that the joint specialist case conferencing team had consultations scheduled in the clinic. The study was briefly described to GPs and participant information statements were provided. Those who indicated interest in participating could then organise a date and for the interview. Prior to the start of the interview, GPs were also invited to read the participant information statement and were asked to sign consent forms.
13. Non-participation	How many people refused to participate or dropped out? Reasons?	There were 25 participants in the study. There were no participants who dropped out. Some PCPs were approached and indicated interest but ultimately decided not to participate because they had limited time to do so or because they had limited experience in providing support for diabetes self-management.
<i>Setting</i>		
14. Setting of data collection	Where were the data collected? (e.g. home, clinic, workplace).	Interviews were conducted face-to-face in the PCP's consultation room.
15. Presence of non-participants	Was anyone else present besides the participants and researchers?	Only the participant and researcher were present at the time of the interview.
16. Description of sample	What are the important characteristics of the sample? e.g. demographic data, date	Table 1. Interviews were conducted between November 2017 and June 2018
<i>Data collection</i>		
17. Interview guide	Were questions, prompts, guides provided by the authors? Was it pilot tested?	Interviews were semi-structured and roughly followed the interview schedule shown in File S1. Questions were asked about how the PCP currently helps patients to self-manage diabetes and their attitudes towards diabetes apps. Participants were also asked for feedback on several specific app features, including: <ol style="list-style-type: none"> 1. A feature that transfers a patient's individualised care plan into the app 2. A feature that exports self-monitoring data to PCP software 3. Prompts to see their PCP (e.g. if there is a pattern of high blood glucose readings) 4. Reminders to book cycle-of-care appointments (e.g. PCP check-ups, and eye and foot checks) 5. Bundles of educational material including videos that can be sent to the patient 6. A 'summary' report of blood glucose self-monitoring to be used by the PCP during the consultation (see Figure S1). These questions, including the sample output material, were developed with feedback from the endocrinologist and diabetes educator who were involved in development of the app for Western Sydney Diabetes. The interview schedule was then piloted with two GPs

18. Repeat interviews	Were repeat interviews carried out? If yes, how many?	to ensure that questions were appropriate and understandable. These GPs had experience in providing diabetes self-management support, but had not used mobile apps extensively with their patients. No repeat interviews were carried out.
19. Audio/visual recording	Did the research use audio or visual recording to collect the data?	All interviews except one were audio-recorded and transcribed verbatim by an independent transcription service. One interview was not audio-recorded as the PCP had requested that only notes be taken (although these were transcribed verbatim as much as possible).
20. Field notes	Were field notes made during and/or after the interview or focus group?	Field notes were only made during one interview (see above), for which the participant had requested no audio-recording be made.
21. Duration	What was the duration of the interviews or focus group?	Interviews lasted an average of 25 min.
22. Data saturation	Was data saturation discussed?	Analysis took place concurrently and iteratively as interviews were conducted. This meant that saturation was discussed with the research team throughout the analysis process. The project team concluded that theoretical saturation was reached after 25 interviews, where variation in PCP attitudes could be adequately explained through three main overarching themes.
23. Transcripts returned	Were transcripts returned to participants for comment and/or correction?	Transcripts were not returned to participants for comment and/or correction.
