

Supplementary material

Taxonomic revision of five species groups of ebracteate-erect *Myosotis* (Boraginaceae) endemic to New Zealand, based on morphology, and description of new subspecies

Heidi M. Meudt

Museum of New Zealand Te Papa Tongarewa, PO Box 467, Cable Street, Wellington, 6140, New Zealand.

Email: heidim@tepapa.govt.nz

Table S1. List of vouchers of all 105 *Myosotis* specimens (including 103 newly measured here) analysed in the morphological dataset of the present study

Specimens are from the five focal species subgroups, including *M. albosericca*, *M. brockiei*, *M. capitata*, *M. cinerascens*, *M. concinna*, *M. goyenii*, *M. laeta*, *M. monroi*, *M. rakiura*, and *M. traversii*, sorted alphabetically by *a posteriori* species, then by morphological study number. The other 179 specimens in the morphological dataset are listed in Meudt *et al.* (2013; the *M. petiolata* group), and Meudt *et al.* (2020; the *M. australis* group plus *M. exarrhena*)

Species (<i>a posteriori</i>)	Herbarium accession number	Country	Region	Land district	Locality	Collector and collector number	Date	Morphology study number	Species (<i>a priori</i>)
