**Figure S1:** Kinetics of A53T  $\alpha$ -synuclein fibril formation monitored by the enhancement of thioflavin T fluorescence intensity. Measurements were performed at 37 °C and pH 7.4, with a protein concentration of 20  $\mu$ M, in the absence (grey) or presence (black) of EGCG at a concentration of 40  $\mu$ M. ThT fluorescence was excited at 450 nm, and the emission wavelength was 482 nm.
