Fig. S1. Na: K ratio in root, leaf sheath and leaf on different days after salinity (12 dS m$^{-1}$) treatment; Data for IR29 were not available on day 10 of salinity treatment due to the complete mortality. Values are mean of wet and dry seasons; Bar represents standard error; LSD - least significant difference.
Fig. S2. Total chlorophyll content in 1st fully expanded leaf from top on 3 (A), 7 (B) and 10 (C) days after salinity (12 dS m$^{-1}$) treatment; Data for IR29 were not available on day 10 of salinity treatment due to the complete mortality. Values are mean of wet and dry seasons; Bar represents standard error; LSD - least significant difference.
