## Supplementary Tables

**Table S1:** Summary table of the average (mean  $\pm$  SD) shoot increment, root length, root/shoot length ratio, total number and weight of nodules, number of phyllodes, hydric content of phyllodes, total chlorophylls ( $C_{a+b}$ ) and carotenoids content in the tip and the base of the phyllodes in *A. longifolia* grown for 20 weeks with twelve different treatment combinations. \* $C_{a+b}$  and carotenoids content at phyllode tip in DW+N- treatment had no standard deviation associated since it was only possible to analyze one individual due to the size of the phyllodes.

Treatments	Shoot increment (cm)	Root length (cm)	Root/shoot length ratio	Number of nodules	Total nodule weight (g)	Number of phyllodes	Phyllode water content	$C_{a+b}$ content		Carotenoids content	
								Phyllode tip (mg/cm <sup>2</sup> )	Phyllode base (mg/cm <sup>2</sup> )	Phyllode tip (mg/cm <sup>2</sup> )	Phyllode base (mg/cm <sup>2</sup> )

## Supplementary Figures

**Fig. S1:** Correlation circle obtained by principal component analysis (PCA) of the shoot vigour variables: shoot increment, number of phyllodes, leaf area and phyllodes water content.

**Fig. S2:** Correlation circle obtained by principal component analysis (PCA) of the root development variables: root length, number of nodules, total nodule weight and roots dry weight.

**Fig. S3:** Dendrogram based on cluster analysis of fingerprinting PCR profiles of the isolates from young *A. longifolia* nodules, using the Pearson correlation coefficient and the unweighted pair-group method with arithmetic mean algorithm (UPGMA). Primers used for PCR amplification were PH and GTG5. On the right are represented the treatments from where the bacteria were isolated (soil type, watering, and nutrition regime).
