**Table S1. Local ponderosa pine chronologies from the International Tree-ring Data Bank used to crossdate tree-age and fire-scar samples**

Source: <http://www.ncdc.noaa.gov/paleo/treering.html>

Chronology	Authors	Period	Location (AZ)
Girl's Ranch	Graybill, D.A.	1660–1986	Sitgreaves National Forest
Gus Pearson	Graybill, D.A.	1550–1987	Gus Pearson Natural Area
Walnut Canyon	Graybill, D.A.	1420–1987	Walnut Canyon National Monument
Walnut Canyon	Stokes, M.A.; Harlan, T.P.	1447–1966	Walnut Canyon National Monument

**Table S2. Values used to calculate modern, individual plot-ATFI (Eqn 1)**

Fire years in each plot, with the number of scars recording the fire year in parentheses.  $\Sigma\text{TA}$  (tree age) is the sum of number of years each tree sampled in the plot, was alive during the analysis period. SN (scar number) is the number of scars found among the trees sampled in the plot. Mean SF (scarring fraction) is the observed fraction of trees receiving a scar, from each individual fire-year, averaged among all fires years in the plot

Plot	Fire years	$\Sigma\text{TA}$	SN	Mean SF	ATFI
1	2007 (3), 1984 (8)	754	11	0.212	14.5

**Table S3. Modern mean fire intervals (*MFI*) estimated by each parameter across the study area, and eastern and western subareas and compared to the population *MFI* from fire rotation**

Parameter refers to (1) the mean plot-all-tree-fire-interval (*ATFI*) calculated by Eqn 1, (2) mean plot-*CFI<sub>all</sub>* calculated from fire years on all scarred samples, (3) mean plot-*CFI<sub>10%</sub>* from fire years recorded on ≥10% of the scarred, recording samples in each plot, (4) mean plot-*CFI<sub>25%</sub>* from fire years recorded on ≥25% of the scarred, recording samples in each plot, (5) pooled *ATFI* based on the sum of all tree ages (*TA*) and scars (*SN*), and mean scarring fraction (*SF*) of all plots within the subarea and (6) pooled *CFI<sub>all</sub>* based on all fire years found on all scars within the subarea. All *CFI* parameters were calculated over the full analysis period (1979–2007). *n* refers to either (1) number of individual-plot parameters averaged together for each of the mean plot-parameters or (2) number of intervals between fires for the pooled parameters. *MFI* refers to the mean fire interval (years) estimated by each parameter. Range is the difference between the highest and lowest plot estimate of *MFI* in a subarea. s.e. refers to the standard error or the estimate of the standard deviation based on sample data (Ott 1988). Absolute error (years) calculated as the absolute value of the difference between population *MFI* and estimated *MFI*. Relative error (%) calculated as RE (%) = 100 × (Absolute error/population *MFI*). Probabilities are significant at: \*, *P* < 0.05

**Table S5. Historical mean fire intervals (*MFI*) estimated by each parameter across the study area and eastern and western subareas and compared to population *MFI*s**

Mean plot refers to parameter values derived by averaging plot values across plots within the subarea. Pooled refers to: (1) *CFI* values calculated as the average interval between fires by pooling all, 10% or 25% scarred, recording samples in a subarea or (2) *ATFI* values calculated by summing tree ages (*TA*) and scar numbers (*SN*), and averaging scarring fractions (*SF*) among all plots in the subarea. FP refers to full analysis period, meaning the *CFI<sub>all</sub>*, *CFI<sub>10%</sub>* or *CFI<sub>25%</sub>* was calculated as the average interval between fire years found on all, 10% or 25% of recording samples, as well as the interval between the beginning and end of the analysis period. F2F refers to fire-to-fire intervals, meaning the *CFI<sub>all</sub>*, *CFI<sub>10%</sub>* or *CFI<sub>25%</sub>* was calculated from the average interval between only fire years found on all, 10% or 25% scarred, recording samples. *n* refers to either 1) number of individual-plot parameters averaged together for each of the mean plot-parameters or 2) number of intervals between fires for the pooled parameters. *MFI* refers to the mean fire interval (years) estimated by each parameter. Range is the difference between the highest and lowest plot estimate of *MFI* in a subarea. s.e. refers to the standard error or the estimate of the standard deviation based on sample data (Ott 1988). Absolute error (years) calculated as the absolute value of the difference between population *MFI* and estimated *MFI*. Relative error (%) calculated as RE (%) = 100×(Absolute error/population *MFI*). Probabilities are significant at: \*, *P* < 0.05
