Supplementary Figure 1: Relationships amongst thirteen *Petrogale* species (including eight subspecies) in a BEST species tree (phylogram) using both mitochondrial and nuclear sequence data, including posterior probabilities and major clades indicated by their taxon group. *Dendrolagus* spp. are used as an outgroup. Figure modified from Potter et al. (2012).
Supplementary Figure 2: The distribution of all Petrogale taxa in Australia with the arid zone indicated by the dotted line, modified from Potter et al. (2012) and Eldridge and Close (1993) to include estimated habitat range of the newly recognised species *P. wilkinsi*, previously included under *P. brachyotis* (Potter et al. 2015).
