General information

All experiments were conducted with a sealed pressure vessel. $^1$H-NMR spectra were obtained at 500 MHz in CDCl$_3$ ($\delta = 7.26$ ppm). Coupling constants are given in hertz. $^{13}$C-NMR spectra were recorded at 126 MHz in CDCl$_3$ ($\delta = 77.0$ ppm). Chemical shifts are given in $\delta$ (ppm) and are measured relative to tetramethylsilane (TMS) as internal standard. The peak patterns are indicated as follows: s, singlet; d, doublet; t, triplet; q, quartet; m, multiplet; qui, quintet; sxt, sextet. HRMS was recorded by using Q-TOF mass spectrometer. Flash column chromatography was performed over silica gel (200–300 mesh).

Synthesis of substrates

General procedure for the synthesis of 3-arylmethylbenzo[d]isothiazole 1,1-dioxide 1

The Grignard reagent was typically prepared according known literature$^{[1]}$. To a 50-mL three-neck flask, metallic magnesium in the form of chips (20.7 mmol, 1.1 equiv), I$_2$ (1.0 mg) were added and exchanged with N$_2$ for three times, then 7.0 mL of dry ether was injected by a syringe and the reaction mixture was warmed to 40°C followed by add 0.75 mmol of halide derivative to initiate the reaction (the color of iodine disappears). Then the remaining 18.0 mmol of halide derivative was diluted with 7.0 mL of ether and dropped into the cooled reaction solution with ice water bath. After completion of the addition, the grey–black mixture was warmed to room temperature and stirred for further 2 h.

To a flame-dried flask were added saccharin (0.92 g, 5.0 mmol) and anhydrous diethyl ether (10 mL) and the solution was then cooled to −30°C. Fresh benzylmagnesium chloride (15 mmol, in 15 mL Et$_2$O) was added dropwise to the above solution over 20 min. The reaction mixture was stirred at −30°C for 24 h, then quenched with a solution of saturated aqueous NH$_4$Cl and diluted with water (30 mL). The mixture was extracted with EtOAc (3 × 50 mL). The combined organic layers were dried over anhydrous Na$_2$SO$_4$, filtered, and concentrated under reduced pressure. The corresponding residue was purified by column chromatography on silica gel (petroleum ether/EtOAc = 4/1) to give benzyl cyclic $N$-sulfonylimines 1$^{[2]}$.

Synthesis of products

General procedure for the synthesis of (1,1-dioxidobenzo[d]isothiazol-3-yl)(aryl)methanone 2

A 10-mL sealed tube was charged with Co(OAc)$_2$ ⋅ 4H$_2$O (1.0 mg, 0.004 mmol), $N$-hydroxyphthalimide (13.2 mg, 0.08 mmol), substrate 1 (0.4 mmol) and exchanged with O$_2$ for three times and BuOAc:Pyridine (1 mL, 7:3 v/v) was injected by a syringe. The mixture was stirred at 90°C for 10 h under O$_2$ atmosphere (1 atm). Once completed, the reaction mixture was cooled, evaporated under reduced pressure. The residue was purified by column chromatography on silica gel (petroleum ether/EtOAc
or petroleum ether/dichloromethane) followed by crystallization with EtOAc to give target product 2.
