Nest Destruction.—I was very interested in Mr. Marshall's "Problem in Nest Destruction," as on November 1, 1929, I found the nest of a White-throated Warbler (*Gerygone olivacea*), which I had been watching, with its side torn out and the long tail caught up on a twig; the hole looked just like the one in Mr. Marshall's photograph. The young birds were two days old. Another instance came to my notice on December 30, 1931. I watched for a long time three well-grown young Forest Kingfishers (*Halcyon macleayi*) in a hole in a Termite's nest on a stringy-bark. I was interested in the strange sounds they made and in the white tips to their bills. The late sun shone full on the hole, and showed up the wonderful blue of the parents as they came to feed the young. The next day the small circular hole was torn and ragged and much enlarged, and there was no sign of either parents or young. I put this down to Kookaburras, a pair of which had a nesting hole with young in not far away. But I never could imagine what destroyed the Warbler's nest.—(Mrs.) ETHEL COMRIE-SMITH, R.A.O.U., Eight Mile Plain, Qld.
