2700 MHz observations of 4C radio sources in the declination zone $+4^\circ$ to -4° .
By J. V. Wall

Abstract. Most sources in the 4C catalogue with declinations between $+4^\circ$ and -4° have been observed at 2700 MHz. Accurate positions, flux densities, and the results of a search for optical identifications are presented. A brief comparison is made with results from other investigations.
