**Contents**      Volume 46      Number 1      1993

Papers presented at the Tenth National Congress of the Australian Institute of Physics,  
University of Melbourne, 10–14 February 1992

Foreword. *Peter Hannaford* 1

## Elementary Particles and Fields

The challenge of the EMC effect. *A. W. Thomas, K. Saito and  
A. Michels* 3

## Nuclear Physics

Recent developments in nuclear physics. *Torleif E. O. Ericson* 15

## Atomic and Molecular Physics

Single atom experiments and the test of quantum physics. *H. Walther* 37

Quantum measurements in atomic optics. *D. F. Walls, M. J. Collett,  
E. P. Storey and S. M. Tan* 61

Wave function collapse in atomic physics. *D. T. Pegg* 77

## Optical Physics

Canterbury ring laser and tests for nonreciprocal phenomena. *G. E. Stedman,  
H. R. Bilger, Li Ziyuan, M. P. Poulton, C. H. Rowe, I. Vetharaniam and  
P. V. Wells* 87

Optical interferometry: The post-Michelson era. *P. Hariharan* 103

## Cross-Disciplinary Physics

Method for production of uniform thin films from the vapour phase.  
*Geoff N. Pain* 121

## Atmospheric Physics

Observations of atmospheric dynamics using radar techniques.  
*B. H. Briggs* 127

Water vapour and its role in the Earth's greenhouse. *Graeme L. Stephens and  
Stephen A. Tjemkes* 149

## Astronomy and Astrophysics

Solar flares: Current dissipation or magnetic annihilation? *D. B. Melrose* 167

Large-scale magnetic fields in spiral galaxies. *S. Spencer and L. Cram* 195

# Australian Journal of Physics

A journal for the publication of original research in all branches of physics

---

Contents      Volume 46      Number 2      1993

## Review Article

Analyses of recent experimental and theoretical determinations of  $e\text{-H}_2$  vibrational excitation cross sections: assessing a long-standing controversy.  
*R. W. Crompton and M. A. Morrison* 203

## Elementary Particles and Fields

Variational wavefunctions for non-compact  $U(1)$  lattice gauge theory: comparison with exact result. *D. O'Shaughnessy and C. J. Burden* 231

## Atomic and Molecular Physics

Some remarks on the use of effective charges in the study of electron impact ionisation processes.  
*Colm T. Whelan, H. R. J. Walters and R. M. Dreizler* 241

Momentum transfer cross section for  $e^{\text{-}}\text{-Kr}$  scattering.  
*M. J. Brennan and K. F. Ness* 249

## Fluids, Plasmas and Electric Discharges

Anisotropic dispersion of a charged particle swarm in a turbulent gas in an electrostatic field. *R. E. Robson* 261

Collisionless damping of fast and ion-cyclotron surface waves.  
*G. W. Rowe* 271

## Condensed Matter

Effect of short-range repulsive interactions on the dynamics of the methane molecule. *M. K. Kansal and S. K. Trikha* 305

Minority carrier diffusion lengths for high purity liquid phase epitaxial GaAs.  
*K. S. A. Butcher, D. Alexiev and T. L. Tansley* 317

## Nanostructure and Two-dimensional Electron Systems

Papers presented at the second Gordon Godfrey Workshop on Condensed Matter Physics, University of New South Wales, Sydney, 20–21 July 1992

Foreword. 327

Introduction. *D. Neilson and M. P. Das* 329

Quantum mechanics and superconductivity in a magnetic field.  
*A. H. MacDonald, Hiroshi Akerai and M. R. Norman* 333

Quantum dots in strong magnetic fields: Stability criteria for the maximum density droplet. *A. H. MacDonald, S.-R. Eric Yang and M. D. Johnson* 345

Electronic properties of quasi-one-dimensional semiconductor nanostructures: Plasmons and exchange-correlation effects in quantum wires.  
*S. Das Sarma and Ben Yu-Kuang Hu* 359

Spontaneously symmetry-broken current-carrying states in nanostructures.  
*Mark Rasolt and F. Perrot* 381

Plasmons on wide epitaxially-grown quantum wells. *John F. Dobson* 391

Electron liquid in double-layer structures. *L. Świerkowski, D. Neilson and J. Szymański* 423

Characterisation of III–V multilayers grown by low-pressure metal organic vapour-phase epitaxy. *C. Jagadish, A. Clark, C. A. Larsen, N. Hauser, M. Petrávic, T. D. Thompson, T. Halstead and J. S. Williams* 435

Charge fluctuations in high-electron-mobility transistors: A review.  
*F. Green* 447

# Australian Journal of Physics

---

Contents      Volume 46      Number 4      1993

## General Physics

The discrete ordinate/pseudo-spectral method: Review and application from a physicist's point of view. *R. E. Robson and Arnstein Prytz* 465

## Atomic and Molecular Physics

Optical oscillator strengths from 'electron impact photoionisation' in the RCE potential. *R. Padma and P. C. Deshmukh* 497

## Fluids, Plasmas and Electric Discharges

Covariant formulation of the ponderomotive force.  
*Qinghuan Luo and D. B. Melrose* 503

## Condensed Matter

Molecular dynamics of the phase transition in solid deuterated methane.  
*M. K. Kansal and S. K. Trikha* 523

Lattice dynamics of  $\text{YBa}_2\text{Cu}_3\text{O}_{6+x}$  ( $x = 0.25, 0.5, 0.75$ ).  
*K. K. Yim, J. Oitmaa and M. M. Elcombe* 535

Magnetic properties of layered Heisenberg ferromagnets.  
*A. Du and G. Z. Wei* 571

## Cross-disciplinary Physics

Quasi-particle interference effect in the Coulomb blockade problem.  
*C. D. Hu and J. Mahanty* 583

## Geophysics, Astronomy and Astrophysics

An analysis of cosmic ray air showers for the determination of shower age.  
*S. Sanyal, B. Ghosh, S. K. Sarkar, A. Badhra, A. Mukherjee and N. Chaudhuri* 589

Contents      Volume 46      Number 5      1993

## Electrons in Solids—The 1990s and Beyond

Papers in honour of Dr Geoffrey Fletcher on the occasion of his seventieth birthday

Preface. *Trevor R. Finlayson, Michael J. Morgan and Tuck C. Choy* 597

Introduction. *G. K. White* 599

A tight binding model for the density of states of graphite-like structures, calculated using Green's functions. *B. A. McKinnon and T. C. Choy* 601

High-temperature thermodynamics of the Hubbard model.  
*J. Oitmaa and J. A. Henderson* 613

Band structure calculations for the heavy transition metals: Parametrisation methods, band structures and problems with iteration techniques.  
*C. F. Osborne* 625

Local-field effects in the high- $q$ -vector dielectric response of Si.  
*T. W. Josefsson and A. E. Smith* 635

On the effects of gravitational fields on the electrical properties of matter.  
*Geoffrey I. Opat* 647

Electronic structure and spin fluctuations in the fcc Fe-Pd system.  
*P. Mohn, E. Supanetz and K. Schwarz* 651

A pilot study of paramagnetic resonance centres in selected Argyle diamonds.  
*D. R. Hutton and G. J. Troup* 663

Magnetic moment distribution in ferromagnetic Co-Mn alloys.  
*T. J. Hicks and A. R. Wildes* 667

Investigation of magnetic ordering in  $\text{RCo}_{12}\text{B}_6$  ( $\text{R} = \text{Y, Nd}$ ) by  $^{57}\text{Fe}$  Mössbauer spectroscopy. *J. M. Cadogan, S. J. Campbell, X. L. Zhao and E. Wu* 679

A heuristic account of the electron-phonon coupling mechanism in the formation of pre-martensite tweed structures. *Peter Norman* 689

Low-temperature thermal expansion anomalies in indium and its solid solution alloys with thallium. *M. Liu, T. R. Finlayson and T. F. Smith* 695

Electrons in transition metals at high temperatures. *G. K. White* 707

How successfully does angle-resolved photoemission determine the band structure of semiconductors? *Robert Leckey, John Riley, Yong Cai, Jürgen Faul and Lothar Ley* 717

**Contents**      Volume 46      Number 6      1993

## Elementary Particles and Fields

On parametric and dispersive integrals. *R. Delbourgo* 729

Consistent treatment of pion exchange force and meson versus quark dynamics in the nucleon–nucleon interaction. *G. Q. Liu and A. W. Thomas* 737

## Atomic and Molecular Physics

Close coupling theory of positron–hydrogen scattering. *J. Mitroy* 751

Space charge effects in the Cavalleri determination of electron diffusion coefficients in gases. *B. S. Liley* 773

## Fluids, Plasmas and Electric Discharges

Ion–molecule reactions and mobilities of  $\text{SF}_3^+$  and  $\text{SF}_5^+$  ions in  $\text{SF}_6$  gas. *Z. A. Talib and M. Saporoschenko* 799

Effect of streaming and finite geometry on a resonance-like phenomenon in beam–plasma systems. *J. Mukhopadhyay, K. R. Chowdhury and A. R. Chowdhury* 807

Nonlinear aspects of wave propagation in a magnetised plasma in the presence of Coriolis force. *B. Chakraborty, S. N. Paul, A. K. Sur and P. K. Kashyapi* 821

Author Index to Volume 46 839

Papers will be considered for publication if they make an original and significant contribution to any branch of physics. All papers are refereed.

Submission of a paper implies that the results reported have not been published or submitted for publication elsewhere. The journal uses its best endeavours to ensure work published is that of the named authors except where acknowledged, and through its reviewing procedures, that any published results and conclusions are consistent with the primary data. It takes no responsibility for fraud or inaccuracy on the part of the contributors.

**General Presentation.** The work should be presented concisely and clearly in English. Authors have a responsibility to make their papers, where possible, accessible to the non-specialist. In particular, the Introduction should give a brief background to the work and provide a clear statement of the aims of the paper; similarly, the Conclusions should summarise in general terms the major findings of the paper. Authors are advised to note the typographical conventions and layout of headings, tables and illustrations exemplified in recent issues of the Journal. Strict observance of these and the following requirements will shorten the interval between submission and publication. The Managing Editor reserves the right to return poorly presented material to authors for revision.

**Review Papers.** Preference is given to reviews directed at developments in physics which have taken place largely in Australia, but this should not necessarily be seen as a limitation on their nature or scope. Authors interested in publishing a review in the Journal are encouraged to contact and discuss the topic with the Managing Editor or an appropriate member of the Editorial Board.

**Author-prepared compuscripts.** Authors are encouraged to submit manuscripts prepared on disk in the correct journal style and format. Our AJSR-TeX production system can accommodate most TeX formats, including Plain TeX, AMS TeX and LaTeX. MacIntosh diskettes are preferred although IBM MS/DOS diskettes may also be submitted. For further details, please contact the Managing Editor directly.

**Manuscripts.** The original and two copies of the manuscript should be typed double spaced *throughout* on good quality A4 paper. The marginal space on the left-hand side should not be less than 40 mm. All pages of the manuscript must be numbered consecutively, including those containing references, appendices, tables and captions to illustrations, which are to be placed after the text.

**Title.** This should be concise and appropriately informative for retrieval by modern searching techniques. If the paper is one of a numbered series, a reference to the previous part should be given as a footnote on the first page. If it is necessary to consult an as yet unpublished part for a proper understanding of the paper, a copy of the manuscript should be supplied to assist the referees.

**Abstract.** This should state concisely the scope of the work and the principal findings, and should be suitable for direct use by abstracting journals; this will seldom require more than 200 words.

**Footnotes** within the text should be used only when essential. They should be placed within horizontal rules immediately under the lines to which they refer.

**References** are cited in the text by the author(s) and year and are not numbered. Authors are referred to recent issues for the style used in the Journal for citing references to books, periodicals and other literature. Titles of published papers are not included, but the reference must include the title for (i) a paper accepted for publication but not yet published or (ii) a preprint or internal report issued by a university or research institution. No editorial responsibility can be taken for the accuracy of the references; authors are requested to check these with special care. All references in the text must be listed, with the names of authors arranged alphabetically; all entries in this list must correspond to references in the text. Abbreviations of titles of periodicals should conform to those used by the 'Bibliographic Guide for Editors and Authors' (American Chem. Society: Washington, DC, 1974).

**Units.** Authors are encouraged to use the International System of Units (Système International d'Unités). These units should be used for exact measurements of physical

quantities and as far as practical elsewhere. Units which are not SI should be defined by their equivalent in SI units (in parentheses) on their first appearance in the manuscript.

**Mathematical formulae** should be carefully *typed* with symbols in correct alignment and adequately spaced. At least two clear lines should be left above and below all displayed equations. If special symbols must be hand-written, they should be inserted with care and identified by pencilled notes in the margin. Judicious use should be made of the solidus to avoid two-line mathematical expressions in the running text. All long formulae should be displayed, and numbered sequentially throughout the paper, *not* section by section. Vectors should be indicated by single underlinings (not overhead arrows) and tensors by double underlinings. In formulae the  $\exp(yz)$  form is preferred to  $e^{yz}$ . Similarly the square root sign  $\sqrt{\quad}$  should be avoided in favour of a one-half power. For example, write

$$x = \{1 + (ab)^{\frac{1}{2}}\} / [1 + c\{\exp(ky) + \exp(lz)\}].$$

Note that the hierarchy used here is parentheses, followed by curly braces, and then square brackets.

**Tables** should be numbered with arabic numerals and be accompanied by a title. They should be arranged having regard to the dimensions of the printed page, and the number of columns should be kept to a minimum. Long headings to columns should be avoided by the use of explanatory footnotes. Each table must be referred to in the text and its approximate position should be indicated in the margin of the manuscript. Only in exceptional circumstances will presentation of essentially the same data in tabular and graphical form be permitted; where adequate, the latter form should be used.

**Illustrations.** The originals and three copies are required. Half-tone illustrations and line drawings are to be numbered in a common sequence. Each illustration must be referred to in the text and its approximate position should be indicated in the margin. A typed list of captions is required. The Journal encourages the submission of *lettered* original line drawings and photographs that are suitable for direct reproduction. A detailed guide for the preparation of illustrations is available on application to the Managing Editor. If facilities are not available to the author for lettering of illustrations to a suitable standard, *unlettered* illustrations may be submitted with copies lettered in ink by hand. However, authors intending to submit lettered originals must comply with the following instructions. Unsatisfactory figures will be returned for correction. Please note that *coloured* illustrations are permitted but, because of the high printing costs involved, the costs must be met separately by the authors.

**Line Drawings** must be drawn with black ink on board, drawing or tracing paper, and with regard to the size of the printed page (12.5 by 20 cm). The dimensions must not exceed 30 by 50 cm; if originals are larger than this they should be photographically reduced and high-quality bromide prints used as originals. Lettering should be in the typeface 'Helvetica' with only the first letter of the first word and of any proper names capitalised. The *x*-height after reduction should be 1.2–1.3 mm. Thus, for the preferred reductions of figures to 30, 40 or 50% of original linear dimensions, the initial *x*-height of lettering should be 4, 3 or 2.5 mm respectively. Symbols and grid marks should be the same respective sizes, and curves and axes should then be either 0.8, 0.7 or 0.6 mm thick respectively. Proportionately smaller sizes of type, symbols, grid marks and curve thicknesses should be used for lesser reductions. Grid marks should point inwards; legends of axes should state the quantity being plotted and be followed by the appropriate SI units in parentheses.

**Photographs** must be of the highest quality with a full range of tones and of good contrast. Before being mounted, photographs must be trimmed squarely to exclude features not relevant to the paper and be separated from neighbouring photographs by uniform spaces that will be 2 mm wide after reduction. Lettering should be in a transfer 'Helvetica' type and contrast with its background; thus white lettering should be used on darker backgrounds. The size of lettering should follow the same guidelines given above for line drawings.

For further information contact the Managing Editor, *Australian Journal of Physics*, P.O. Box 89, East Melbourne, Vic. 3002, Australia.
