Residual forest structure influences behaviour of Pacific marten (*Martes caurina*) on post-fire landscapes

**Logan A. Volkmann and Karen E. Hodges**

*International Journal of Wildland Fire* **31**, 329–349

Wildfire and post-fire salvage logging alter forest structure, but consequences for wildlife are uncertain. We examined forest-specialist Pacific marten (*Martes caurina*) on three recently-burned landscapes in Washington and British Columbia. Marten selected lightly-burned sites with overhead cover and high structural complexity, but avoided severely-burned and salvage-logged sites lacking these features.

The role of decomposer communities in managing surface fuels: a neglected ecosystem service

**H. Gibb J. J. Grubb, O. Decker, N. Murphy, A. E. Franks and J. L. Wood**

*International Journal of Wildland Fire* **31**, 350–368

Ground fuels (leaf litter and logs) are important in forest fires, but how decomposer organisms (invertebrates, fungi and bacteria) affect fuel breakdown is rarely considered. We review the evidence for the importance of decomposer organisms and its regulation by global change, highlighting knowledge gaps and the way forward.

Estimating dead fine fuel moisture content of forest surface, based on wireless sensor network and back-propagation neural network

**Wei-Dong Lei, Ying Yu, Xing-Hui Li and Jian Xing**

*International Journal of Wildland Fire* **31**, 369–378

In this paper, wireless sensor network and back-propagation neural network were used to estimate the dead fine fuel moisture content (FFMC) of forest surface. The method can be well applied to forest surface dead FFMC estimation and early fire danger assessment, having practical significance for forest fire protection.

Simulation-based high-resolution fire danger mapping using deep learning

**Frédéric Allaire, Jean-Baptiste Filippi, Vivien Mallet and Florence Vaysse**

*International Journal of Wildland Fire* **31**, 379–394

We propose a new method for short-term fire danger mapping using deep learning based on simulated fire sizes. High-resolution maps can be obtained in a few hours using actual weather forecasts and terrain data. Application to 13 fire cases shows relevant predictions of potential for fire spread.

Variability in pyrogenic carbon properties generated by different burning temperatures and peatland plant litters: implication for identifying fire intensity and fuel types

**Chuanyu Gao, Jinxin Cong, Yang Sun, Dongxue Han and Guoping Wang**

*International Journal of Wildland Fire* **31**, 395–408

Pyrogenic carbon (PyC), generated by fire, acts as a stable carbon deposit and is stored in the peatland soil carbon pool. PyC chemical compositions and thermal stability are significantly affected by burning temperature and fuel sources, and can be used to identify PyC sources and fire intensity.

Comparison of fire-produced gases from wind tunnel and small field experimental burns

**David R. Weise, Wei Min Hao, Stephen Baker, Marko Princevac, Amir-Hessam Aminfar, Javier Palarea-Abaladejo, Roger D. Ottmar, Andrew T. Hudak, Joseph Restaino and Joseph J. O'Brien**

*International Journal of Wildland Fire* **31**, 409–434

Pyrolysis measurements from simplified fuel beds in a wind tunnel were compared to pyrolysis measurements collected during prescribed burns in longleaf pine. Compositional data techniques were applied to predict gas composition of pyrolysis or flaming combustion samples. Relative dominance of some gases differed between wind tunnel and field measurements.

Organisational influence on the co-production of fire science: overcoming challenges and realising opportunities

**Evora Glenn, Laurie Yung, Carina Wyborn and Daniel R. Williams**

*International Journal of Wildland Fire* **31**, 435–448

There is a growing interest in connecting fire science and management through processes like co-production of fire science, which can increase the relevance and utility of research products by integrating diverse knowledge and goals. Research organisations can enable and incentivise co-production through modifications to performance evaluations, funding structures and career ladders.

Predicting daily initial attack aircraft targets in British Columbia  
**S. W. Taylor and K. Nadeem**  
*International Journal of Wildland Fire* **31**, 449–468

Statistical learning methods were used to develop predictive models of the likely number and location of daily airtanker and helicopter initial attack targets in British Columbia, Canada, that can inform the day-basing or prepositioning of aircraft to reduce response times.

Corrigendum to: Predicting daily initial attack aircraft targets in British Columbia  
*International Journal of Wildland Fire* **31**, 469

Collecting pyrolysis gases during low intensity prescribed burns in longleaf pine at Ft Jackson in the Carolina Sandhills of the southeastern United States. Compare the field fire behavior with wind tunnel fire behavior in Fig. 1 of Weise *et al.* (pp. 409–434). This photo was taken by a US Government employee and is in the public domain.
