Fig. S1. Transect survey start times on the 35 nights that surveys were conducted between 07 January and 13 March 2016, and in relation to sunset and different twilight classification cut-offs for the island of Saipan, Commonwealth of the Northern Mariana Islands (CNMI). Usually each person surveyed four approximately hour-long transects between ca 1900 and 2300 h; each symbol represents the start of one such transect. In January surveying usually commenced during the astronomical twilight (i.e., with the sun 12–18° below the horizon), whereas in March surveying usually commenced during nautical twilight (sun 6–12° below the horizon).
