## Appendix S1: Calculation of sample weights

Sample weights were calculated for all participants to account for over-representation of women with a tertiary education in the study population compared to the Australian female population aged 18-23 years at the 2011 Australian Census.

Weights for the study population, $\mathrm{W}(\mathrm{x})$ at each education level x , were calculated using the formula:

$$
\mathrm{W}(\mathrm{x})=\mathrm{P}(\mathrm{x}) / \mathrm{N}(\mathrm{x})
$$

where $\mathrm{P}(\mathrm{x})$ is the prevalence of women aged 19-26 in the Australian population with education level ( x ) and $\mathrm{N}(\mathrm{x})$ is the prevalence of women in the study population with education level (x).

| Education level | Prevalence Australian <br> 2011 Census - <br> women aged 18-23 <br> years <br> $\mathbf{P ( x )}$ | Prevalence in <br> study population <br> $\mathbf{N}(\mathbf{x})$ | Sample weights <br> $\mathbf{P ( x )} / \mathbf{N}(\mathbf{x})$ |
| :--- | :---: | :---: | :---: |
|  | 0.093 |  |  |
