Forest fire occurrence and climate change in Canada

Appendix 1

Human-caused fire occurrence models were developed using ecoregions (Fig. A1) within each province as a base unit of analysis using the following form, based on model form used in Wotton *et al.* (2003):

$$\ln(N_{HUMp}) = \alpha_{0,p} + \alpha_{1,p}(ECOREGION) + \alpha_{2,p} \cdot FFMC + \alpha_{3,p}(ECOREGION) \times FFMC + \alpha_{4,p} \cdot DMC + \alpha_{5,p} \cdot DC + \alpha_{6,p} \cdot CAUSE_GROUP + \alpha_{7,p} \cdot SEASON \quad (1)$$

where CAUSE_GROUP = 1 for the spring cause group and 0 for the summer cause group; SEASON = 1 in spring and = 0 in summer; and subscript p represents province.

Coefficients for this model appear in Tables A1 to A4. Models were fit using generalized linear modelling (PROC GENMOD, SAS Institute, 2002). Terms not significant at the $\alpha = 0.05$ (95% confidence) level were dropped from the model.

Fig. A1. Labelled ecoregion-based spatial units in which regression models were developed.

Appendix 2

Lightning-caused fire occurrence models were developed, again using ecoregions shown in Fig. A1, using the following form, based on model form used in Wotton *et al.* (2003) and Wotton & Martell (2005),

$$\ln(N_{\text{LTG}}) = \beta_{0,p} + \beta_{1,p,r} \cdot \text{ECOREGION} + \beta_{2,p} \cdot \text{DMC} + \beta_{3,p,r} \cdot \text{ECOREGION} \times \text{DMC} + \beta_{4,p} \cdot \text{FFMC} + \beta_{5,p} \cdot \text{DC} + \beta_{6,p} \cdot \text{SEASON} + \beta_{7,p} \cdot \text{R}_{\text{CLASS}} \quad (\text{A2})$$

where SEASON = 1 in spring and = 0 in summer; R_{CLASS} is a categorical variable with 6 levels based on the current and previous days rainfall (see footnote B); and subscript p represents province.

Coefficients for this model appear in Tables A5 to A8. Models were fit using generalized linear modelling (PROC GENMOD, SAS Institute 2002). Terms not significant at the $\alpha = 0.05$ (95% confidence) level were dropped from the model.
