## **Supplementary Methods**

### *Optimisation of DNA extraction and sequencing*

*DNA extraction:* Using a preliminary batch of 11 samples from *P. scapulatus* from 4 sites, two kits for DNA extraction were compared: the Nucleospin DNA Food Kit (Macherey-Nagel, Düren, Germany), and the Nucleospin DNA Stool Kit (Macherey-Nagel, Düren, Germany). DNA was extracted with the Stool Kit following the manufacturers protocol. DNA was extracted using the Food Kit following the manufacturers protocol, with the following modifications: samples were homogenised using sterile 3 mm tungsten carbide beads for 1 min in a TissueLyser II (Qiagen, Hilden, Germany). Following homogenisation, we then followed the manufacturer's protocol for extraction of DNA using the NucleoSpin DNA Food Kit except the volume of Elution Buffer CE was decreased to 50 µL to increase the concentration of the final extraction.

*DNA sequencing:* In the first DNA sequencing run, we analysed 49 samples. We trialled two primer pairs for each marker, giving a short and a long PCR product. If the DNA in faecal samples is degraded, then a shorter PCR product is more likely to amplify. However, if the DNA is of good enough quality to amplify a long PCR product, then this will lead to finer taxonomic resolution. The primer combinations are outlined in Table S4. All 49 samples in the sequencing run were analysed with the primer pairs giving short PCR products, while a subset of 7 samples were also analysed with the primer pairs giving long PCR products. The two DNA barcode markers were amplified in separate reactions for each sample. We used an indexing strategy that gave each sample a unique combination of two indices, that were used for both DNA barcodes. The PCR reactions contained primers at a final concentration of 200nM, 12.5 µL of KAPA HiFi ReadyMix (KAPA Biosystems, Boston, Massachusetts, USA), and 8.5 µL of the template DNA (up to 20 ng/µL) in a 25 µL reaction. To increase the chance of detecting all species in the mixture, each DNA extraction was included in three PCR reactions that were amplified separately, i.e., the reaction contents described above were divided between three PCR tubes. The PCR conditions for long PCR fragments

included an initial period of heat activation for 3 min at 95°C; followed by 35 cycles of 30 s at 95°C, 30 s at 55°C, and 1 min at 72°C; followed by a final extension of 10 min at 72°C and then held at 10°C. For the short fragments, following a gradient PCR to determine optimal annealing temperature, PCR was conducted with an initial denaturing step of 95 °C for 3 minutes; followed by 35 cycles of: 95 °C for 30 sec, 55 °C for 30 sec, 72 °C for 1 min; and a final extension at 72 °C for 10 min.

## Supplementary Results

### *Comparison of DNA extraction methods*

Consistently higher DNA concentrations were achieved using the NucleoSpin Food Kit compared to the NucleoSpin Stool Kit (Table S3). While DNA concentration is not the only measure of quality of DNA extraction, we detected no evidence of DNA degradation in any extractions, and the extracted DNA from both methods amplified successfully via PCR, demonstrating that neither method was affected by inhibitors.

### *Comparison of long and short PCR products*

The preliminary run of Illumina MiSeq generated 2,304,061 paired-end 250bp sequencing reads. Of these 449,420 were from the 58 samples sequenced with short PCR products and 1,854,641 were from the 25 samples sequenced with long PCR products. After separating sequences into ITS2 and *rbcL* reads, and analysis via the dada2 bioinformatics pipeline, there remained 47,432 short ITS2 reads, 259,035 short *rbcL* reads, 456,195 long ITS2 reads, 139,295 long *rbcL* forward reads, and 139,152 *rbcL* reverse reads (Table S5). Most ITS2 short reads were lost at the filtering stage, due to poor quality read 2 sequences. Most *rbcL* long reads were lost at the merging step, due to a lack of overlap between the 250bp paired-end reads for the ~550bp PCR product. Based on these results, subsequent analyses used long PCR products of ITS2 and sequenced them with 300bp paired-end reads.

Table S2: Collection details and accession numbers of plant specimens sequenced for the DNA barcode reference databases

Species	Identified by	Locality name	Geographic coordinates	Collection date	RbcL sequence genbank accession(s)	ITS2 sequence genbank accession(s)
<i>Eucalyptus shirleyi</i>	Andrew Ford	Fletchervale station	19.8576°S, 146.0739°E	01-December-2017	NA	MW139077, MW139078, MW139079
<i>Terminalia platyphylla</i>	Andrew Ford	Serenity Road	20.0401°S, 144.3233°E	01-December-2017	MW178157	MW139082, MW139083, MW139084
<i>Eucalyptus xanthoclada</i>	Andrew Ford	Serenity Road	20.0401°S, 144.3233°E	01-December-2017	NA	MW139080, MW139081
<i>Corymbia dallachiana</i>	Andrew Ford	Southwick Station	19.8200°S, 144.6583°E	01-December-2017	NA	MW139072
<i>Corymbia nesophila</i>	Matt Bradford	Laura	15.5044°S, 144.4818°E	08-May-2018	NA	MW139073, MW139074
<i>Corymbia stockeri</i>	Matt Bradford	Lakefield	15.4320°S, 144.4240°E	08-May-2018	NA	MW139092, MW139093
<i>Corymbia clarksoniana</i>	Matt Bradford	Lakefield	15.2383°S, 144.44038°E	08-May-2018	NA	MW178183, MW139071
<i>Eucalyptus megasepala</i>	Matt Bradford	Laura	15.5044°S, 144.4818°E	08-May-2018	MW178139	MW139074, MW139076
<i>Grevillea pteridifolia</i>	Matt Bradford	Laura	15.5044°S, 144.4818°E	08-May-2018	MW178145	NA
<i>Petalostigma banksii</i>	Matt Bradford	Morehead River	15.029°S, 143.6758°E	08-May-2018	MW178154	MW139131, MW139132
<i>Brachychiton bidwillii</i>	Matt Bradford	Raglan	23.7263°S, 150.8171°E	11-September-2018	MW178133	MW139088, MW139089, MW139090
<i>Ficus racemosa</i>	Matt Bradford	Connors River	22.1459°S, 149.0788°E	31-October-2018	MW178144	NA
<i>Alyxia ruscifolia</i>	Matt Bradford	Raglan	23.7263°S, 150.8171°E	11-September-2018	MW178132	MW139085, MW139086, MW139087

<i>Bauhinia hookeri</i>	Matt Bradford	Moura	24.5031°S, 145.410°E	10-December-2018	MW178147	MW139113, MW139114, MW139115
<i>Syncarpia glomulifera</i> ssp. <i>glomulifera</i>	Matt Bradford	Wongabel	17.3655°S, 145.4881°E	23-October-2019	MW178155	MW139133
<i>Lophostemon suaveolens</i>	Matt Bradford	Wongabel	17.3655°S, 145.4906°E	23-October-2019	MW178146	MW139112
<i>Syzygium suborbiculare</i>	Matt Bradford	Coen	13.7728°S, 143.2526°E	05-October-2019	MW178156	MW139134, MW139135, MW139136
<i>Eucalyptus tereticornis</i>	Matt Bradford	Rossmoya	23.0377°S, 150.4072°E	02-November-2018	MW178143	MW139108, MW139109, MW139110, MW139111
<i>Eucalyptus tereticornis</i>	Matt Bradford	Herberton	17.355°S, 145.408°E	10-August-2018	MW178142	MW139106, MW139107
<i>Eucalyptus populnea</i>	Andrew Ford	The Overflow	22.2553°S, 149.0011°E	17-October-2017	MW178141	MW139104, MW139105
<i>Eucalyptus crebra</i>	Matt Bradford	The Overflow	22.2553°S, 149.0011°E	17-July-2017	MW178138	MW139101, MW139102

Table S5: Number of sequencing reads remaining in each sequencing run, following each step in the bioinformatics pipeline.

Function “filtered” discards low quality reads and trims low quality sequence from the ends of reads; “denoised” identifies sequencing reads that are likely to contain sequencing errors; “merged” merges the forward and reverse sequencing reads; “nonchim” removes sequences that are likely to be chimeric; and “decontam” removes sequences that are likely to be contaminants.

	<b>input</b>	<b>filtered</b>	<b>denoisedf</b>	<b>denoisedr</b>	<b>merged</b>	<b>nonchim</b>	<b>decontam</b>
<b>Sequencing run 1 ITS2 short</b>	311590	124531	124156	119752	68172	47432	NA <sup>1</sup>
<b>Sequencing run 1 <i>rbcL</i> short</b>	311754	304797	304168	304612	300999	259035	NA
<b>Sequencing run 1 ITS2 long</b>	1199614	525566	524209	524134	470702	456195	452128
<b>Sequencing run 1 <i>rbcL</i> long forward reads</b>	146399	139389	139309	NA	NA <sup>2</sup>	139295	138335
<b>Sequencing run 1 <i>rbcL</i> long reverse reads</b>	146399	139389	NA	139302	NA	139152	138192
<b>Sequencing run 2 ITS2</b>	7760594	3652757	3643972	3642588	3273833	3237449	3129419
<b>Sequencing run 2 <i>rbcL</i></b>	3362556	2093838	2091057	2092200	2073928	2034417	1973615
<b>Sequencing run 3 ITS2</b>	4806873	3758276	3749813	3747863	3403067	3339911	3261146
<b>Sequencing run 3 <i>rbcL</i></b>	4157706	3787126	3783886	3784987	3767349	3629924	3579131

<sup>1</sup> The “decontam” function was not run for the short sequencing reads, as these were not included in the final analysis.

<sup>2</sup> The 250bp forward and reverse reads from run 1 were too short to allow merging for the ~550bp long *rbcL* amplicon, and were analysed as single-end reads

**Table S5: Taxonomic identifications based on ITS2 long sequences, using the AssignTaxonomy and AssignSpecies functions in dada2. Sequences with fewer than 10,000 reads across the study removed. Samples with fewer than 1000 reads removed. Taxa not identified to species can be placed to species level using local knowledge of species distribution and flowering phenology.**

Family, genus, and plausible alternative species-level identifications	Number of samples
Annonaceae Genus undetermined Species undetermined	1
Fabaceae <i>Erythrina</i> Species undetermined	18
<i>Bauhinia</i> <i>carronii/hookeri</i>	16
