**Fig. S1.** Experiment 2: Normalised relative quantity (NRQ) of five Pi transporter genes in roots of wild-type (black bars) and *rmc* (open bars) tomato 6 weeks after transplanting. The amounts of (a) *LeTP1*, (b) *LeTP2*, (c) *LeTP3*, (d) *LeTP4* and (e) *LePT5* transcripts were estimated by quantitative real-time PCR and normalised against the amount of *Le18S* rRNA transcripts. Four biological replicates were analysed for non-inoculated controls (NM) and five for plants inoculated with *Scutellospora calospora*. Means with different letters are significantly different. When letters are between two bars the effect is between NM and plants inoculated with *S. calospora*.
